(54) Title: METHOD AND DEVICE FOR THREADING A WEB IN THE REELING OF A PAPER OR BOARD WEB

(57) Abstract: The invention relates to a method for threading a web in the reeling of a paper or board web, in which method a tail strip (W) of the web is passed into a reeling nip between a reeling drum (10) and a reel spool (12), on which reel spool (12) a web roll is formed, in which method the tail strip (W) of the web is conducted on the surface of the reeling drum (10) by means of suction arranged in the reeling drum (10). In the method, the tail strip (W) of the web is passed into the reeling nip between the reeling drum (10) and the reel spool (12) by means of a suction zone (20) which extends substantially around the entire circumference of the reeling drum and which is situated on the surface of the reeling drum (10) in an area where a full-width web runs during reeling, so that the tail strip (W) of the web can be conducted directly along the suction zone (20). The invention also relates to a device for threading a web in the reeling of a paper or board web, which device is a reeling drum (10) which is used in the reeling of a paper or board web and which is arranged to form a reeling nip with a reel spool (12), around which reel spool (12) a web roll is arranged to be

formed, which reeling drum (10) comprises suction apertures to provide a suction effect on the surface of the reeling drum (10). A suction zone (20) is formed in the reeling drum (10). The suction zone (20) extends substantially around the entire circumference of the reeling drum (10), and the suction zone (20) is placed in the longitudinal direction of the reeling drum (10), i.e. in the width direction of the web, in an area where a full-width web is arranged to run during reeling.
